The Requirement for the Features

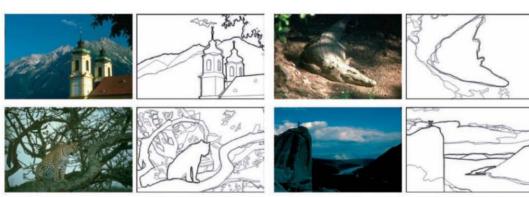

- We don't make it by matching pixel values, but with some higher level information: features
- Requirements
 - Invariant: to lighting, color, rotation, scale, view angle...
 - Locality: features are local, so robust to occlusion and clutter (no prior segmentation)
 - **Distinctiveness**: individual features can be matched to a large database of objects
 - Quantity: many features can be generated for even small objects
 - Efficiency: close to real-time performance
 - ...

Features

Interest points

Edge and lines

Others

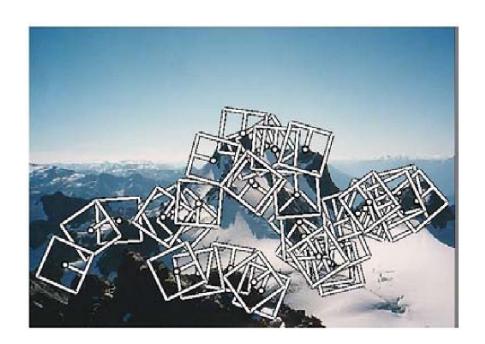

Points and Patches

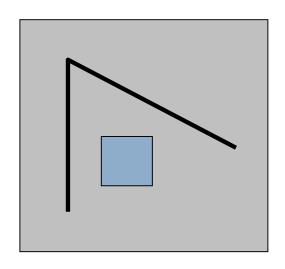

Keypoint Detection and Matching Pipeline

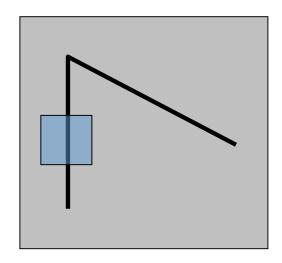

- Feature detection
- Feature description
- Feature matching
- Feature tracking

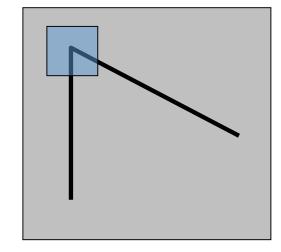

Suppose we only consider a small window of pixels

What defines whether a feature is a good or bad?

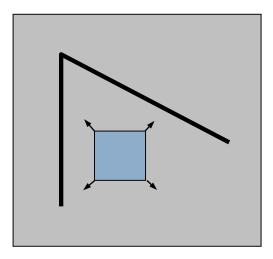

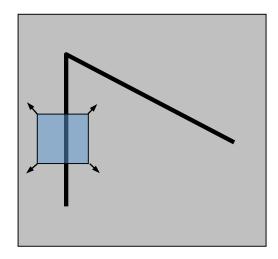

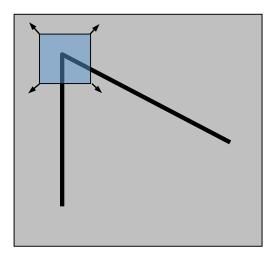

Local measure of feature uniqueness

- How does the window change when you shift it?
- Shifting the window in any direction causes a big change

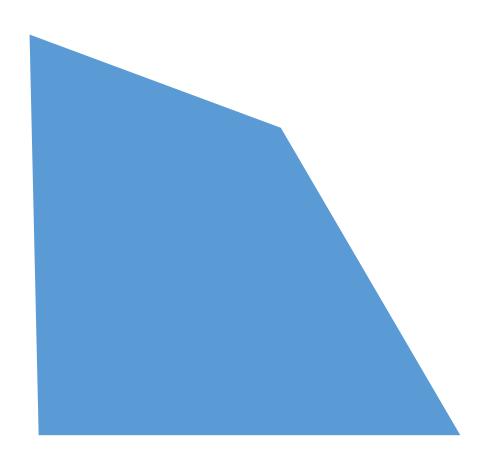

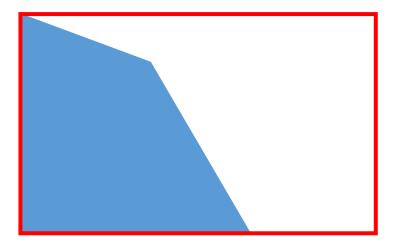

"flat" region: no change in all directions "edge": no change along the edge direction "corner":
significant change
in all directions

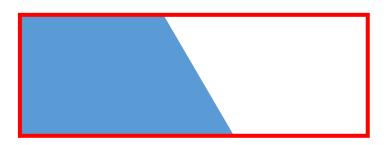

Aperture Problem

Aperture Problem

Aperture Problem

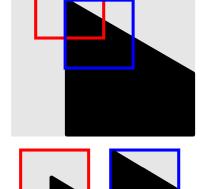

Change of intensity for the shift (u,v):

Auto-correlation function

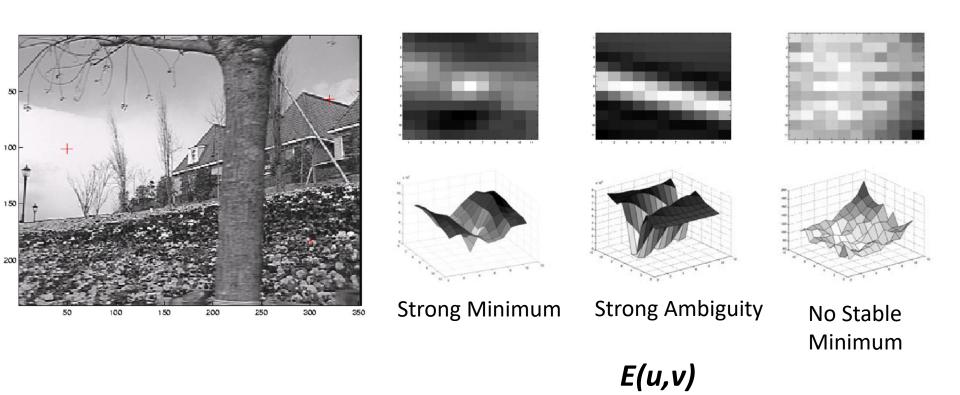

$$E(u,v) = \sum_{x,y} w(x,y)[I(x+u,y+v) - I(x,y)]^{2}$$
window shifted intensity

intensity

$$w(x,y) = \exp\left(-\frac{(x^2 + y^2)}{2\sigma^2}\right)$$

function

Small motion assumption → use Taylor Series expansion

$$E(u,v) = \sum_{x,y} w(x,y) [I(x+u,y+v) - I(x,y)]^{2}$$

$$= \sum_{x,y} w(x,y) [I(x,y) + \nabla I(x,y) \cdot (u,v) - I(x,y)]^{2}$$

$$= \sum_{x,y} w(x,y) [I_{x}(x,y)u + I_{y}(x,y)v]^{2}$$

$$= \sum_{x,y} w(x,y) [I_{x}^{2}(x,y)u^{2} + I_{y}^{2}(x,y)v^{2} + 2I_{x}(x,y)I_{y}(x,y)uv]$$

$$E(u,v) = \sum_{x,y} w(x,y) \left[I_x^2(x,y)u^2 + I_y^2(x,y)v^2 + 2I_x(x,y)I_y(x,y)uv \right]$$

$$E(u,v) \cong \begin{bmatrix} u & v \end{bmatrix} \mathbf{M} \begin{bmatrix} u \\ v \end{bmatrix}$$

, where \mathbf{M} is a 2×2 matrix computed from image derivatives:

$$\mathbf{M} = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

Eigenvectors of Symmetric Matrices

suppose $A \in \mathbf{R}^{n \times n}$ is symmetric, *i.e.*, $A = A^T$ **fact:** there is a set of orthonormal eigenvectors of A

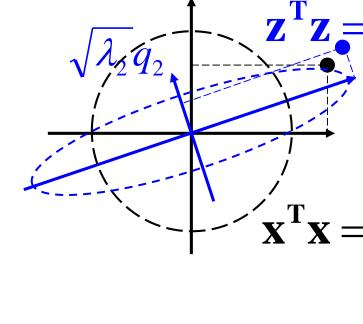

$$A = Q\Lambda Q^T$$
$$\mathbf{x}^{\mathsf{T}} \mathbf{A} \mathbf{x}$$

$$= \mathbf{x}^{T} \mathbf{Q} \Lambda \mathbf{Q}^{T} \mathbf{x}$$

$$= (\mathbf{Q}^{T} \mathbf{x})^{T} \Lambda (\mathbf{Q}^{T} \mathbf{x})$$

$$= \mathbf{y}^{T} \Lambda \mathbf{y}$$

$$= (\Lambda^{\frac{1}{2}} \mathbf{y})^{T} (\Lambda^{\frac{1}{2}} \mathbf{y})$$

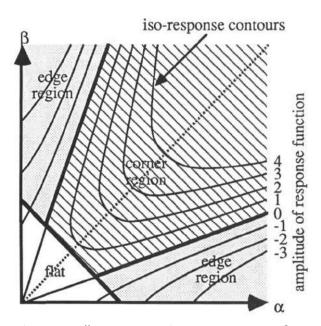

Intensity change in shifting window: eigenvalue analysis

$$E(u,v) \cong [u,v]\mathbf{M} \begin{bmatrix} u \\ v \end{bmatrix}$$
 λ_1, λ_2 - eigenvalues of \mathbf{M}

Ellipse E(u,v) = const

onst direction of the fastest change direction of the slowest change

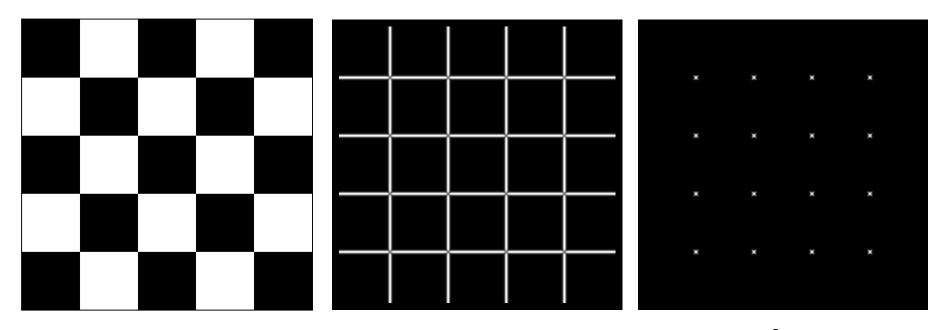

- Feature scoring function
 - $\det(M) \alpha \cdot \operatorname{trace}(M)^2 = \lambda_0 \lambda_1 \alpha (\lambda_0 + \lambda_1)^2$
 - $\lambda_0 \alpha \lambda_1$
 - $\frac{\det M}{\operatorname{trace} M} = \frac{\lambda_0 \lambda_1}{\lambda_0 + \lambda_1}$

Ref: C. Harris and M.J. Stephens, "A combined corner and edge detector," in *Proc. Alvey Vision Conference*, 1988.

Whole feature detection flow:

- Compute the gradient at each point in the image
- Create the **M** matrix from the entries in the gradient
- Compute the eigenvalues.
- Find points with large Feature scoring function

 λ_1

24

Harris Detector Example

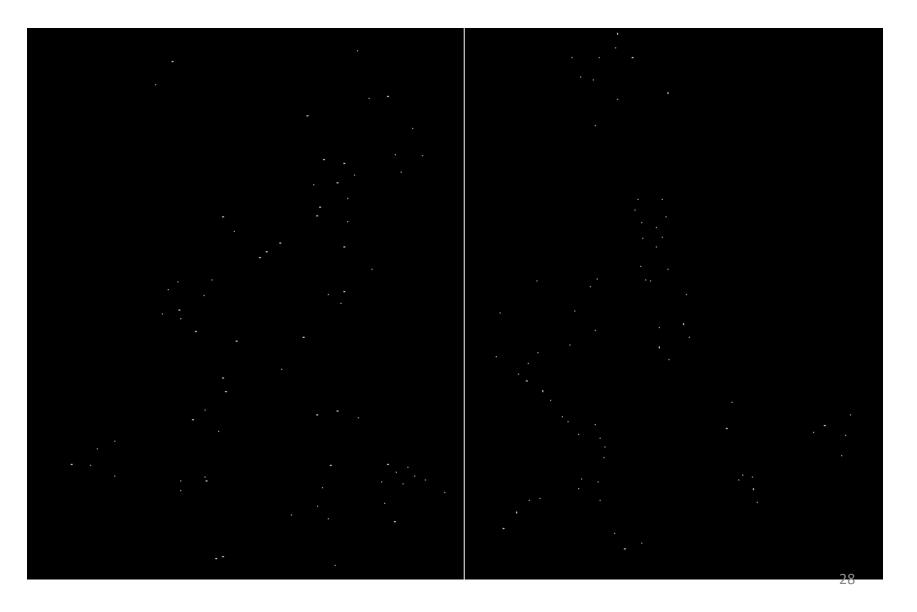

f value (red high, blue low)

Threshold (f > value)

Find Local Maxima of f

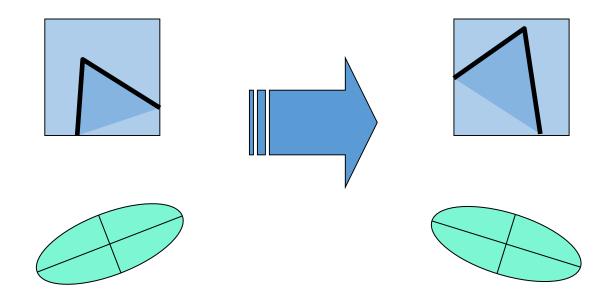

Harris Features (in Red)

Harris Detector: Invariance Properties

Rotation

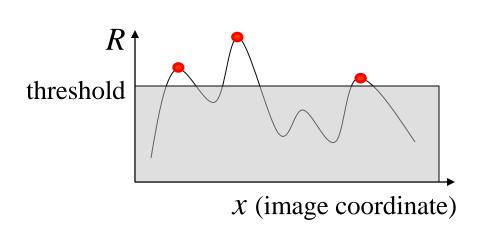

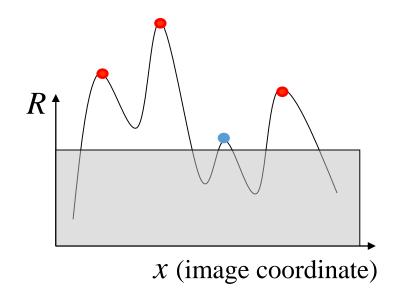

Ellipse rotates but its shape (i.e. eigenvalues) remains the same

Corner response is invariant to image rotation

Harris Detector: Invariance Properties

- Affine intensity change: $I \rightarrow aI + b$
 - ✓ Only derivatives are used => invariance to intensity shift $I \rightarrow I + b$
 - ✓ Intensity scale: $I \rightarrow a I$

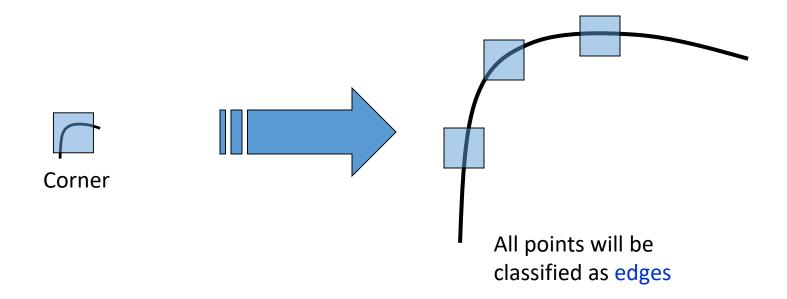

Partially invariant to affine intensity change

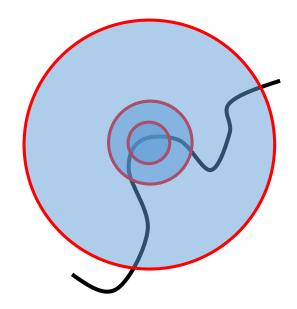

Harris Detector: Invariance Properties

Scaling

Scale Invariant Detection

Suppose you're looking for corners

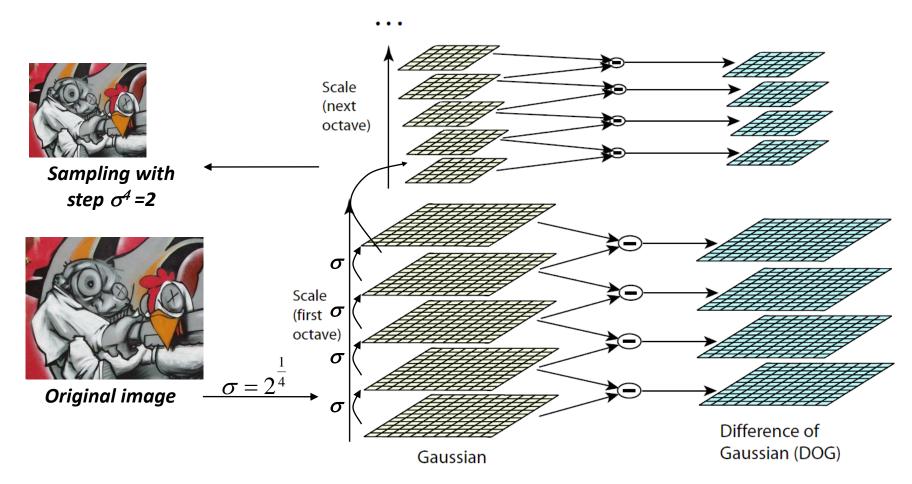

Key idea: find scale that gives local maximum of f

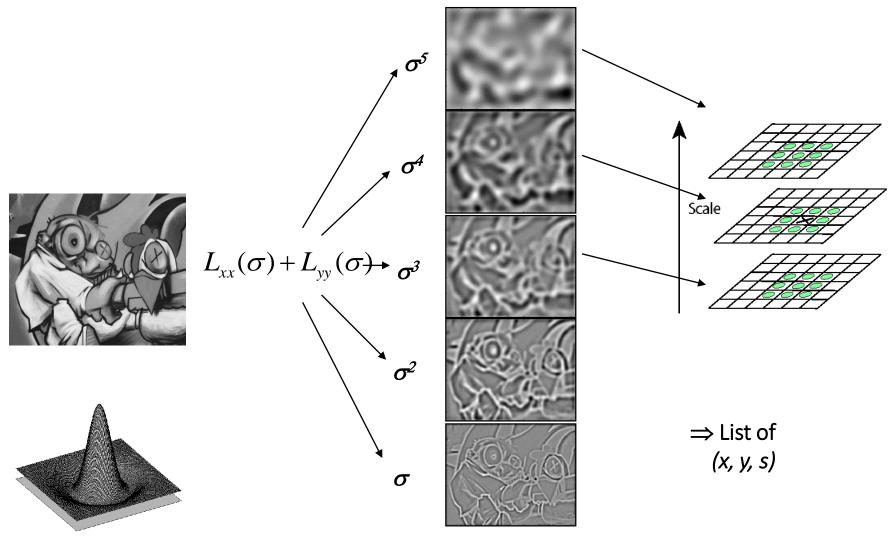

- in both position and scale
- One definition of f: the Harris operator

DoG – Efficient Computation

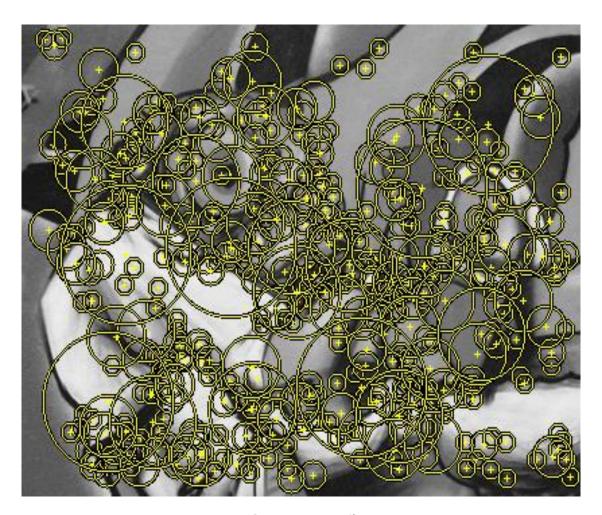

Computation in Gaussian scale pyramid

Find local maxima in position-scale space of Difference-of-Gaussian

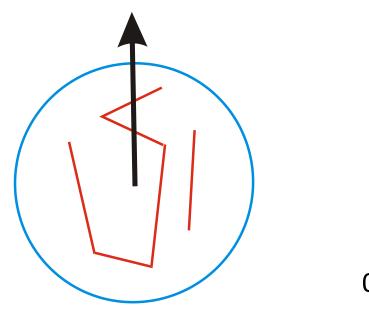

Results: Difference-of-Gaussian

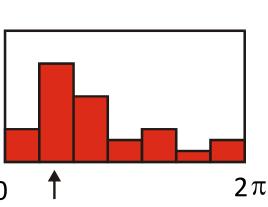

Orientation Normalization

[Lowe, SIFT, 1999]

- Compute orientation histogram
- Select dominant orientation
- Normalize: rotate to fixed orientation

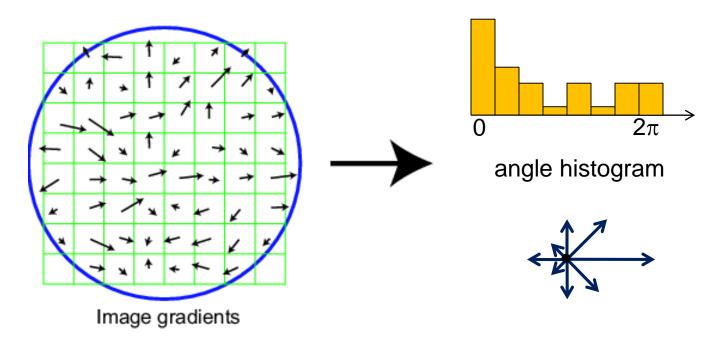

Scale Invariant Feature Transform

Basic idea:

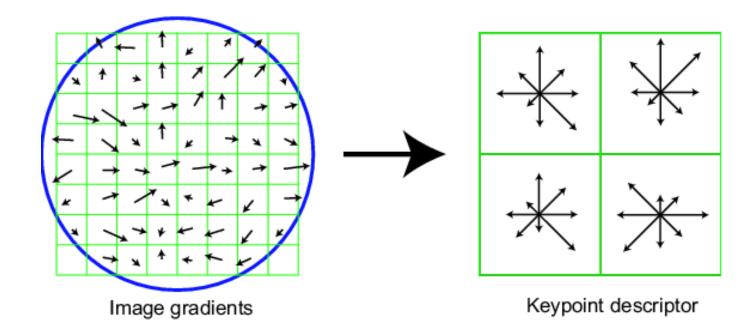

- Take 16x16 square window around detected feature
- Compute edge orientation (angle of the gradient 90°) for each pixel
- Throw out weak edges (threshold gradient magnitude)
- Create histogram of surviving edge orientations

SIFT descriptor

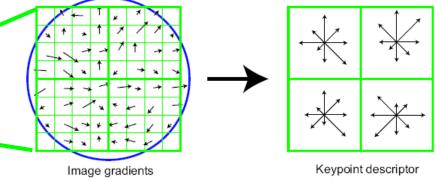

Full version

- Divide the 16x16 window into a 4x4 grid of cells (2x2 case shown below)
- Compute an orientation histogram for each cell
- 16 cells * 8 orientations = 128 dimensional descriptor

Local Descriptors: SIFT Descriptor

Histogram of oriented gradients

- Captures important texture information
- Robust to small translations / affine deformations

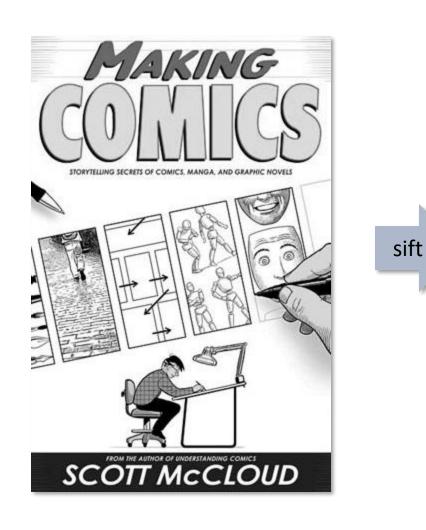

Details of Lowe's SIFT algorithm

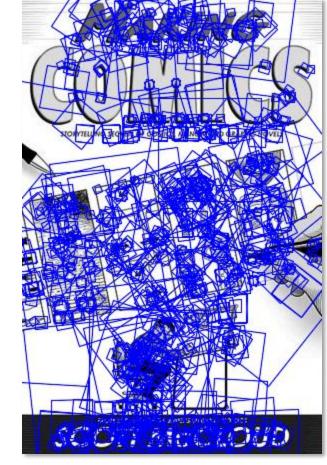

- $\mathbf{H} = \left[\begin{array}{cc} D_{xx} & D_{xy} \\ D_{xy} & D_{yy} \end{array} \right]$
- $\frac{\operatorname{Tr}(\mathbf{H})^2}{\operatorname{Det}(\mathbf{H})} < \frac{(r+1)^2}{r}$

- Run DoG detector
 - Find maxima in location/scale space
 - Remove edge points
- Find all major orientations
 - Bin orientations into 36 bin histogram
 - Weight by gradient magnitude
 - Weight by distance to center (Gaussian-weighted mean)
 - Return orientations within 0.8 of peak
 - Use parabola for better orientation fit
- For each (x,y,scale,orientation), create descriptor:
 - Sample 16x16 gradient mag. and rel. orientation
 - Bin 4x4 samples into 4x4 histograms
 - Threshold values to max of 0.2, divide by L2 norm
 - Final descriptor: 4x4x8 normalized histograms

Ref: D.G. Lowe, "Distinctive image features from scale-invariant keypoints," *International Journal of Computer Vision*, 2004.

SIFT Example

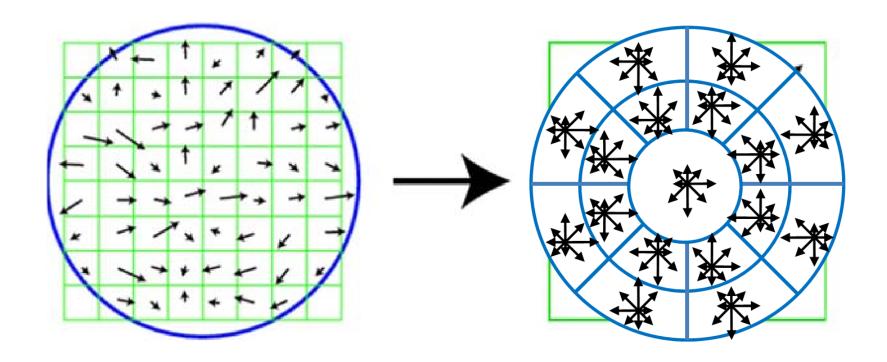

868 SIFT features

PCA SIFT

- 39 x 39 patch \rightarrow 3042-D vector
- Dimension reduction to 36-D with principal component analysis (PCA)

Ref: Y. Ke and R. Sukthankar, "PCA-SIFT: a more distinctive representation for local image descriptors," in *Proc. CVPR2004*.

Gradient Location-Orientation Histogram (GLOH)

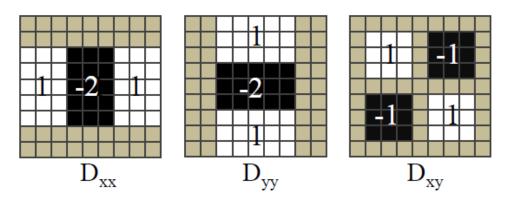

Ref: K. Mikolajczyk and C. Schmid, "A performance evaluation of local descriptors," *IEEE Tran. Pattern Analysis and Machine Intelligence*, 2005.

Speed Up Robust Feature (SURF)

- SURF detector
 - Hessian Matrix Based Interest Points

$$\mathcal{H}(\mathbf{x}, \sigma) = \begin{bmatrix} L_{xx}(\mathbf{x}, \sigma) & L_{xy}(\mathbf{x}, \sigma) \\ L_{xy}(\mathbf{x}, \sigma) & L_{yy}(\mathbf{x}, \sigma) \end{bmatrix}$$

- Approximation for Hessian Matrix
- Low computational cost

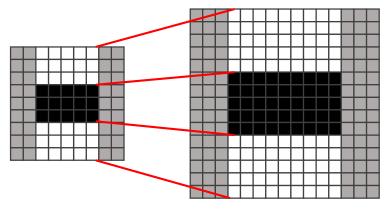

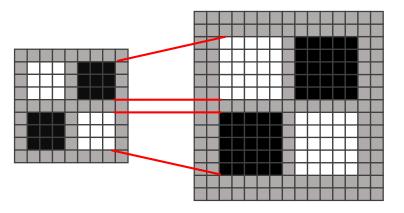

Ref: T. Tuytelaars H. Bay, A. Ess and L. V. Gool, "SURF: Speeded up robust features," in *Proceedings* of Computer Vision and Image Understanding (CVIU), 2008, vol. 110, pp. 346-359.

Speed Up Robust Feature (SURF)

- SURF detector
 - Scale space representation

9x9 15x15

Octave	Filter size	Sampling Interval
1	$9 \times 9, 15 \times 15, 21 \times 21, 27 \times 27$	2
2	$39 \times 39, 51 \times 51$	4
3	$75 \times 75, 99 \times 99$	8
4	$147 \times 147, 195 \times 195$	16
5	$291 \times 291, 387 \times 387$	32

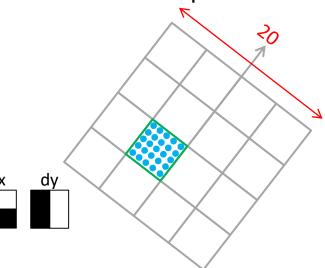

Speed Up Robust Feature (SURF)

Descriptor

- Based on sum of Haar wavelet response
- dx,dy: wavelet responses in x & y direction
- 4x4 sub-region
- Calculate Σdx , Σdy, Σ|dx|, Σ|dy|
- 4*4*4 = 64 dimensions
- 4*4*5*5=400 times calculation for an interest point

 Σdx $\Sigma |dx|$ Σdy $\Sigma |dy|$

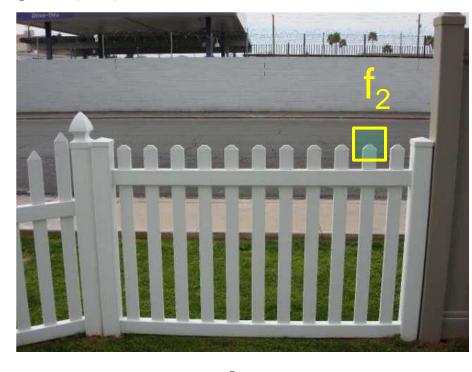

Irregular pattern

How to define the difference between two features f_1 , f_2 ?

- Simple approach is SSD(f₁, f₂)
 - sum of square differences between entries of the two descriptors
 - can give good scores to very ambiguous (bad) matches

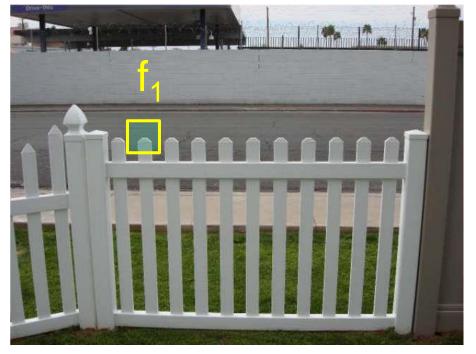

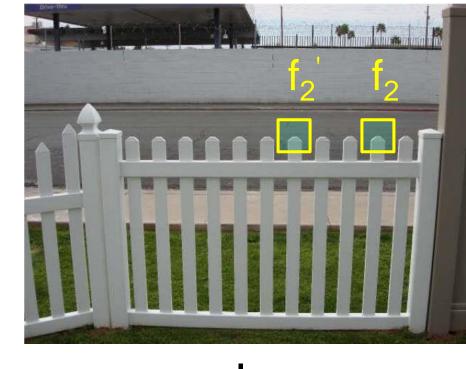

48

How to define the difference between two features f_1 , f_2 ?

- Better approach: ratio distance = $SSD(f_1, f_2) / SSD(f_1, f_2')$
 - f_2 is best SSD match to f_1 in I_2
 - f_2' is 2^{nd} best SSD match to f_1 in I_2
 - gives small values for ambiguous matches

2

- Matching? The difference < threshold
- How to evaluate?

Predicted matches
Predicted non-matches

True matches		
TP = 18	FP = 4	P' = 22
FN = 2	TN = 76	N' = 78
P = 20	N = 80	Total = 100

PPV = 0.82

$$TPR = 0.90$$
 $FPR = 0.05$

ACC = 0.94

TP: true positives

• FN: false negatives

• FP: false positives

TN: true negatives

How to evaluate?

Predicted matches Predicted non-matches

True matches	True non-matches	
TP = 18	FP = 4	P' = 22
FN = 2	TN = 76	N' = 78
P = 20	N = 80	Total = 100

PPV = 0.82

TPR = 0.90FPR = 0.05 ACC = 0.94

True positive rate (TPR), recall

$$TPR = \frac{TP}{TP + FN} = \frac{TP}{P}$$

• False positive rate (FPR), false alarm $FPR = \frac{FP}{FP + TN} = \frac{FP}{N}$

$$FPR = \frac{FP}{FP + TN} = \frac{FP}{N}$$

Positive predictive value (PPV), precision

$$PPV = \frac{TP}{TP + FP} = \frac{TP}{P'}$$

• Accuracy (ACC)
$$ACC = \frac{TP + TN}{P + N}$$

 $TPR = \frac{TP}{TP + FN}$

True positive rate (TPR)

 $FPR = \frac{FP}{FP + TN}$

How to evaluate?

False positive rate (FPR)

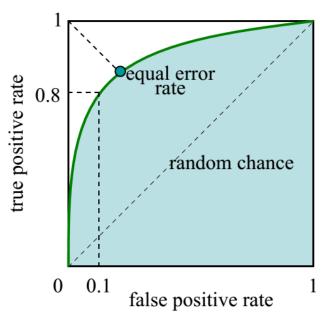

Positive predictive value (PPV)

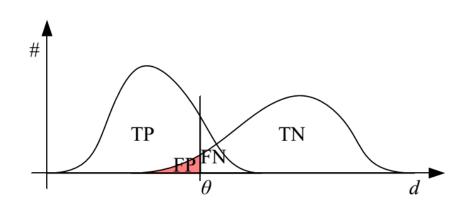

$$PPV = \frac{TP}{TP + FP}$$

Accuracy (ACC)

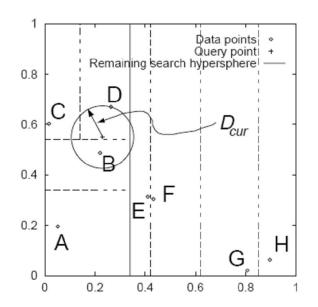

ROC curve (Receiver Operating Characteristic)

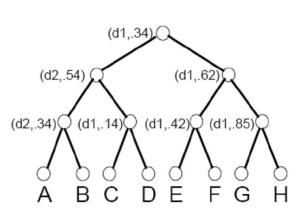

$$ACC = \frac{TP + TN}{P + N}$$

- Efficient matching
 - Full search
 - Indexing structure
 - Multi-dimensional hashing
 - Locality sensitive hashing (LSH)
 - K-d tree

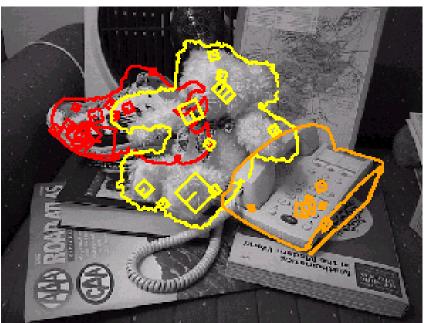

Applications

Features are used for:

- Image alignment (e.g., mosaics)
- 3D reconstruction
- Motion tracking
- Object recognition
- Indexing and database retrieval
- Robot navigation
- ... other

Object Recognition (David Lowe)

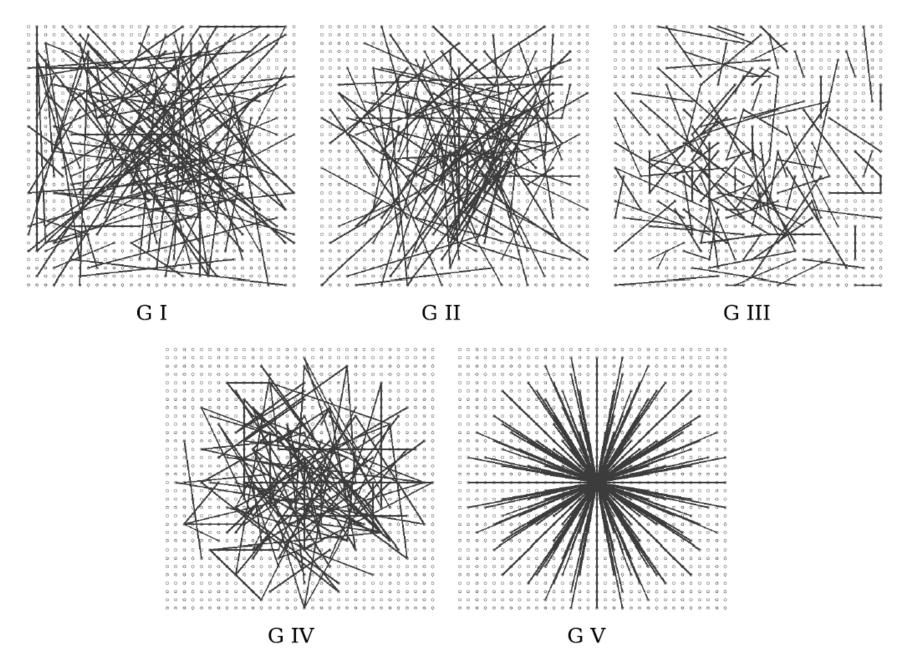

BRIEF (ECCV 2010)

• We define test τ on patch \mathbf{p} of size $S \times S$ as

$$\tau(\mathbf{p}; \mathbf{x}, \mathbf{y}) := \begin{cases} 1 & \text{if } \mathbf{p}(\mathbf{x}) < \mathbf{p}(\mathbf{y}) \\ 0 & \text{otherwise} \end{cases}$$

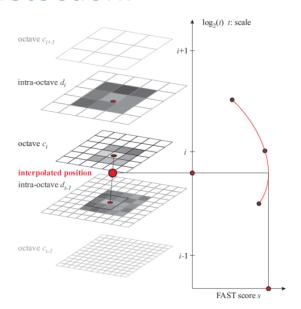

- where $\mathbf{p}(\mathbf{x})$ is the pixel intensity in a smoothed version of \mathbf{p} at $\mathbf{x} = (u, v) \top$.
- Choosing a set of n_d (x,y)-location pairs uniquely defines a set of binary tests.
 - We take our BRIEF descriptor to be the n_d -dimensional bitstring

$$f_{n_d}(\mathbf{p}) := \sum_{1 \le i \le n_d} 2^{i-1} \ \tau(\mathbf{p}; \mathbf{x}_i, \mathbf{y}_i)$$

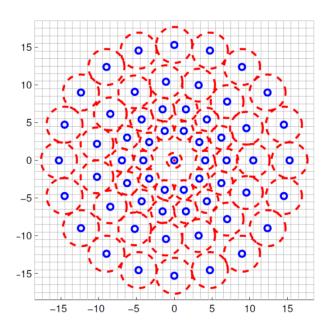

BRISK (ICCV2011)

Scale-space keypoint detection:

Keypoint description:

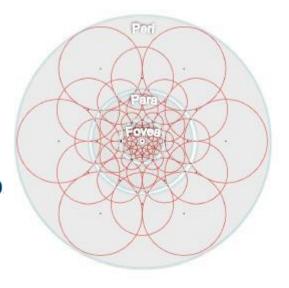

$$b = \begin{cases} 1, & I(\mathbf{p}_{j}^{\alpha}, \sigma_{j}) > I(\mathbf{p}_{i}^{\alpha}, \sigma_{i}) \\ 0, & \text{otherwise} \end{cases}$$
$$\forall (\mathbf{p}_{i}^{\alpha}, \mathbf{p}_{j}^{\alpha}) \in \mathcal{S}$$

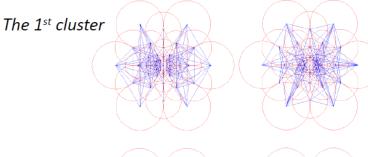

FREAK (CVPR 2012)

- Retinal sampling pattern
- Coarse-to-fine descriptor

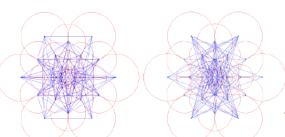

$$F = \sum_{0 \le a < N} 2^a T(P_a) \qquad T(P_a) = \begin{cases} 1 & \text{if } (I(P_a^{r_1}) - I(P_a^{r_2}) > 0, \\ 0 & \text{otherwise,} \end{cases}$$

- How to select pairs?
 - Learn the best pairs from training data

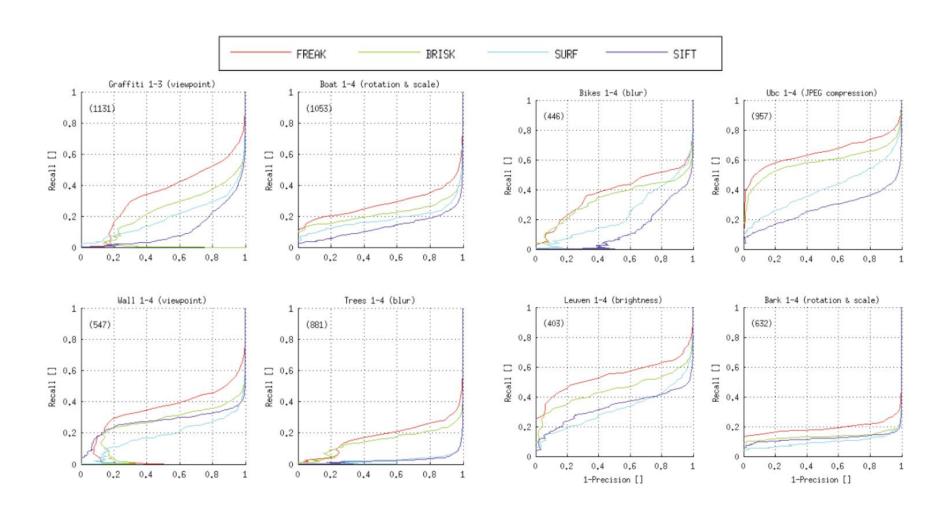

4 clusters 128 pairs per group

The last cluster

FREAK (CVPR 2012)

ORB: An efficient alternative to SIFT or SURF

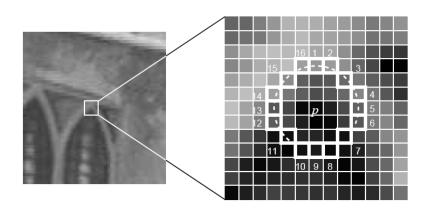

ORB = oFAST + rBRIEF

- oFAST: FAST Keypoint Orientation
- rBRIEF: Rotation-Aware Brief

E. Rublee, V. Rabaud, K. Konolige and G. Bradski, "ORB: An efficient alternative to SIFT or SURF," in *Proc. 2011 International Conference on Computer Vision*, Barcelona, 2011.

FAST¹

- Features from Accelerated Segment Test.
 - The segment test criterion operates by considering a circle of sixteen pixels around the corner candidate p.
 - The original detector classifies p as a corner if there exists a set of n contiguous pixels in the circle which are all brighter than the intensity of the candidate pixel I_p + t, or all darker than I_p - t.

Orientation by Intensity Centroid

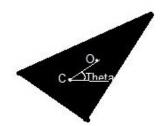

Moments of a patch

$$m_{pq} = \sum_{x,y} x^p y^q I(x,y)$$

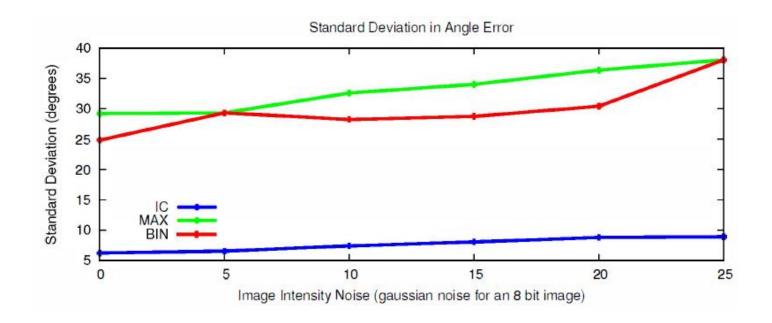

with these moments we may find the centroid

$$C = \left(\frac{m_{10}}{m_{00}}, \frac{m_{01}}{m_{00}}\right)$$

• We can construct a vector from the corner's center, O, to the centroid, \overrightarrow{OC} .

Rotation Measure

- IC: intensity centroid
- MAX chooses the largest gradient in the keypoint patch
- BIN forms a histogram of gradient directions at 10 degree intervals, and picks the maximum bin.

Steered BRIEF

Steer BRIEF according to the orientation of keypoints.

$$\mathbf{S} = egin{pmatrix} \mathbf{x}_1, \dots, \mathbf{x}_n \ \mathbf{y}_1, \dots, \mathbf{y}_n \end{pmatrix}$$

• Using the patch orientation θ and the corresponding rotation matrix R_{θ} , we construct a "steered" version S_{θ} of S:

$$\mathbf{S}_{ heta} = \mathbf{R}_{ heta} \mathbf{S}$$

Now the steered BRIEF operator becomes

$$g_n(\mathbf{p}, \theta) := f_n(\mathbf{p}) | (\mathbf{x}_i, \mathbf{y}_i) \in \mathbf{S}_{\theta}$$

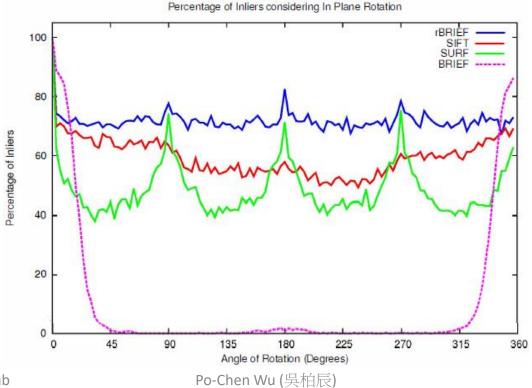

Learning Good Binary Features

The algorithm is:

- 1. Run each test against all training patches.
- 2. Order the tests by their distance from a mean of 0.5, forming the vector T.
- 3. Greedy search:
 - (a) Put the first test into the result vector R and remove it from T.
 - (b) Take the next test from T, and compare it against all tests in R. If its absolute correlation is greater than a threshold, discard it; else add it to R.
 - (c) Repeat the previous step until there are 256 tests in R. If there are fewer than 256, raise the threshold and try again.

Results (1/3)

 Matching performance of SIFT, SURF, BRIEF with FAST, and ORB (oFAST +rBRIEF) under synthetic rotations with Gaussian noise of 10.

Media IC & System Lab 67

Results (2/3)

 Matching behavior under noise for SIFT and rBRIEF. The noise levels are 0, 5, 10, 15, 20, and 25. SIFT performance degrades rapidly, while rBRIEF is relatively unaffected.

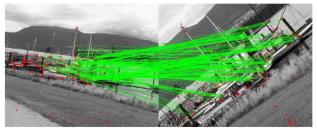

68 Media IC & System Lab

Results (3/3)

• Test on real-world images:

	inlier %	N points
Magazines		
ORB	36.180	548.50
SURF	38.305	513.55
SIFT	34.010	584.15
Boat		
ORB	45.8	789
SURF	28.6	795
SIFT	30.2	714

Computation Time

• The ORB system breaks down into the following times per typical frame of size 640x480.

ORB:	Pyramid	oFAST	rBRIEF
Time (ms)	4.43	8.68	2.12

Detector	ORB	SURF	SIFT
Time per frame (ms)	15.3	217.3	5228.7

Pascal 2009 dataset 2686 images at 5 scales

Edges and Lines

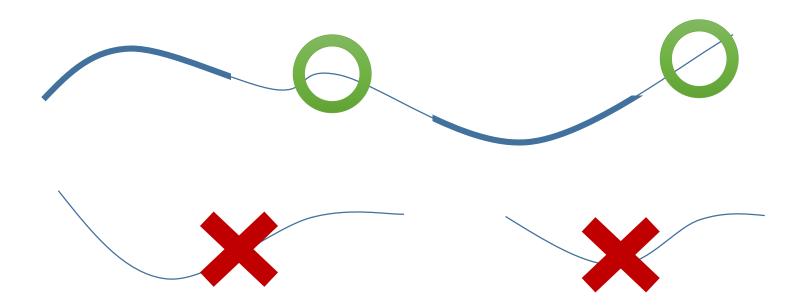

Y. Cao, C. Wang, L. Zhang and L. Zhang, "Edgel index for large-scale sketch-based image search," in *Proc. CVPR 2011*.

Edge Detection

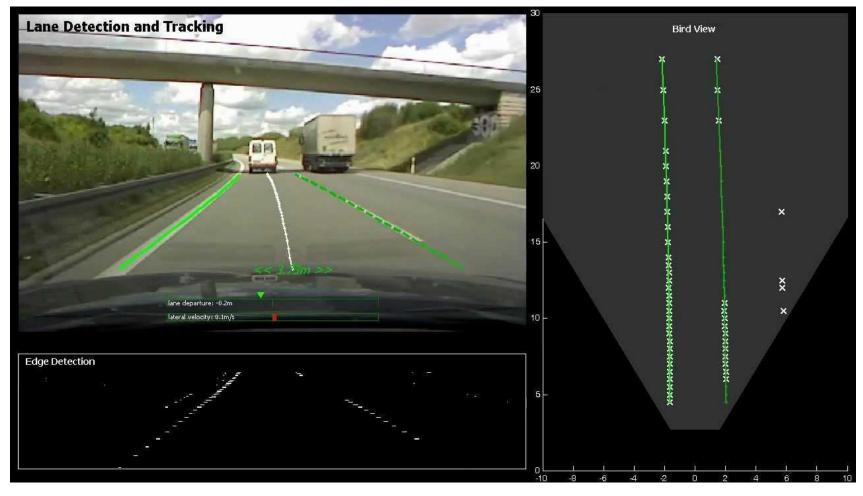

- Canny edge detector
 - The most widely used edge detector
 - The best you can find in existing tools like MATLAB, OpenCV...
- Algorithm:
 - Apply Gaussian filter to reduce noise
 - Find the intensity gradients of the image
 - Apply non-maximum suppression to get rid of false edges
 - Apply double threshold to determine potential edges
 - Track edge by hysteresis: suppressing weak edges that are not connected to strong edges

Hysteresis

• Find **connected components** from strong edge pixels to finalize edge detection

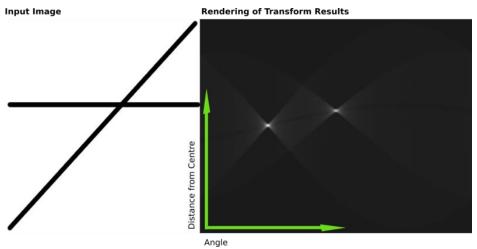

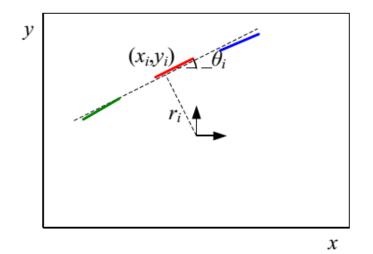

Hough Transform

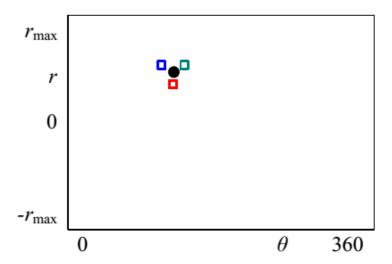

Hough Transform

- Vote in (θ, r) space
 - (Many choices)

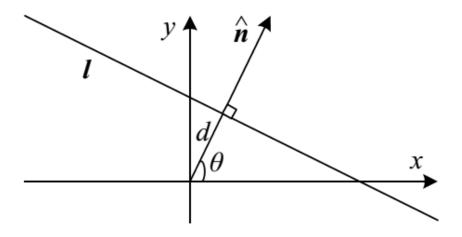

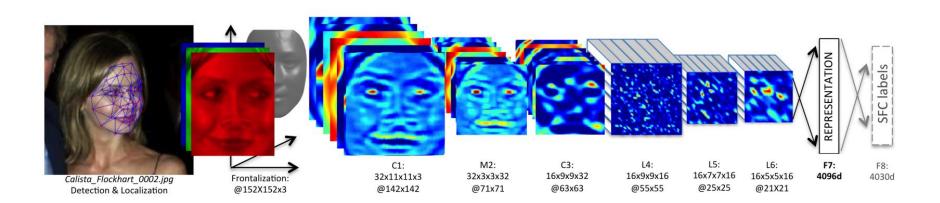

Hough Transform

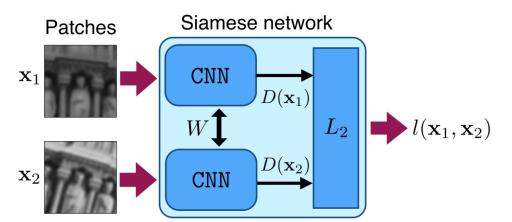

- Clear the accumulator array
- For each detected edgel at location (x, y) and orientation $\theta = tan^{-1}n_y/n_x$, compute the value of $d = xn_x + yn_y$ and increment the accumulator corresponding to (θ, d)
- Find the peaks in the accumulator corresponding to lines
- Optionally re-fit the lines to the constituent edgels

- Features extracted from Deep Neural Network
 - Ex. Deep Face (CVPR2014)

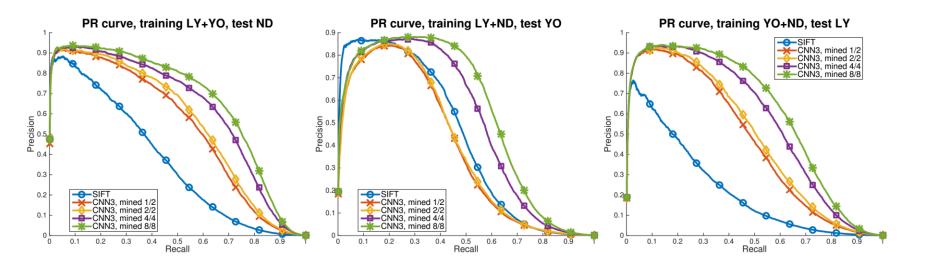

Layer	1	2	3
Input size	64 × 64	29 × 29	8 × 8
Filter size	7 × 7	6 × 6	5 × 5
Output channels	32	64	128
Pooling & Norm.tion	2×2	3×3	4×4
Nonlinearity	Tanh	Tanh	Tanh
Stride	2	3	4

Loss function:

$$l(\mathbf{x}_1, \mathbf{x}_2) = \begin{cases} ||D(\mathbf{x}_1) - D(\mathbf{x}_2)||_2, & p_1 = p_2 \\ \max(0, C - ||D(\mathbf{x}_1) - D(\mathbf{x}_2)||_2), & p_1 \neq p_2 \end{cases}$$

Appendix: MPEG-7 Descriptors

Introduction

- MPEG-7 is a standard for describing features of multimedia content
- MPEG-7 provides the world's richest set of audiovisual descriptions
- Comprehensive scope of data interoperability
- Based on XML

Introduction

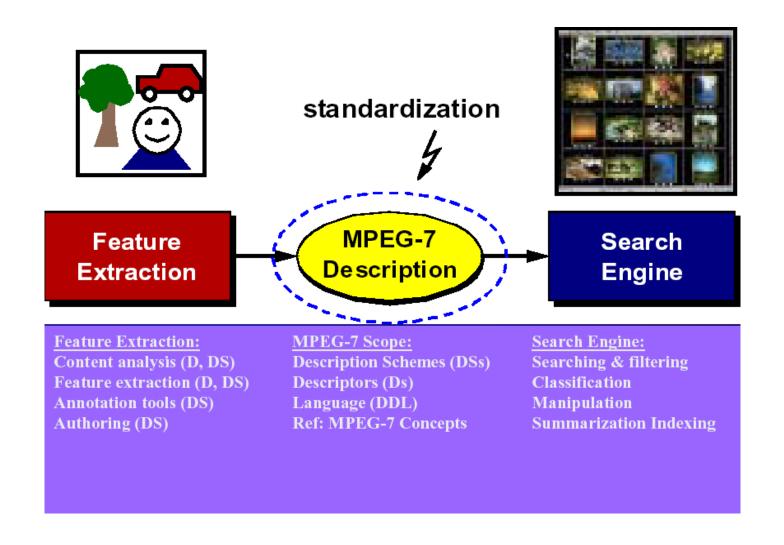

- General visual descriptors
 - Color
 - Texture
 - Shape
 - Motion
- Domain-specific visual descriptors
 - Face recognition descriptors

What is Standardized?

Only define the descriptions

- Not standardize how to produce the descriptions
- Not standardize how to use the descriptions
- Only define what is needed for the interoperability of MPEG-7 enabled systems

What is Standardized?

Color Descriptors

- Color Space Descriptor
- Dominant Color Descriptor
- Scalable Color Descriptor
- Group of Frames (or Pictures) Descriptor
- Color Structure Descriptor
- Color Layout Descriptor

Example: Dominant Color Descriptor (1)

- Compact description
- Browsing of image databases based on single or several color values
- Definition:
 - $F = \{(c_i, p_i, v_i), s\}, (i = 1, 2, ..., N) (N < 9)$
 - c: color value vector (default color space: RGB)
 - p_i : percentage ($\sum_i p_i = 1$
 - v: optional color variance
 - s : spatial coherency

Dominant Color Descriptor (2)

Binary syntax of DCD

Field	Number of Bits	Meaning
NumberofColors	3	Specifies number of dominant colors
SpatialCoherency	5	Spatial Coherency Value
Percentage[]	5	Normalized percentage associated with each dominant color
ColorVariance[][]	1	Color variance of each dominant color
Index[][]	1—12	Dominant color values

Dominant Color Descriptor (3)

- Extraction:
 - Clustering is performed in a perceptually uniform color space (Lloyd algorithm)
 - Distortion :

$$D_i = \sum_{n} h(n) ||x(n) - c_i||^2, x(n) \in C_i$$
• **x**(n)_n: the color vector at pixel n

- h(n): perceptual weight for pixel n
- c: centroid of cluster Ci

$$c_i = \frac{\sum h(n)x(n)}{\sum h(n)}, x(n) \in C_i$$

Dominant Color Descriptor (4)

• Extraction:

- The procedure is initialized with one cluster consisting of all pixels and one representative color computed as the centroid of the cluster
- The algorithm then follows a sequence of centroid calculation and clustering steps until a stopping criterion (minimum distortion or maximum number of iterations)

Dominant Color Descriptor (5)

• Extraction:

- Spatial coherency (s):
 - 4 connectivity connected component analysis
 - Individual spatial coherence: normalized average number of the connected pixels of each dominant color
 - s = (individual spatial coherence)
 - S is no huniformly quantized to 5 bits,
 - 31 means highest confidence
 - 1 means no confidence
 - 0 means not computed

Dominant Color Descriptor (6)

- Similarity Matching:
 - Number of representative colors is small, one can first search the database for each of the representative color separately, then combine.

Dominant Color Descriptor (7)

- Similarity Matching:
 - Consider 2 DCDs:

$$F_1 = \{(\mathbf{c}_{1i}, p_{1i}, v_{1i}), s_1\}, \quad (i = 1, 2, ..., N_1) \text{ and}$$

$$F_2 = \{(\mathbf{c}_{2i}, p_{2i}, v_{2i}), s_2\}, \quad (i = 1, 2, ..., N_2).$$

• Dissimilarity (D):

$$D^{2}(F_{1}, F_{2}) = \sum_{l=1}^{N_{1}} p_{1i}^{2} + \sum_{l=1}^{N_{2}} p_{2j}^{2} - \sum_{l=1}^{N_{1}} \sum_{l=1}^{N_{2}} 2a_{1i,2j}p_{1i}p_{2j}$$

$$a_{k,l} = \begin{cases} 1 - d_{k,l}/d_{\max} & d_{k,l} \leq T_{d} \\ 0 & d_{k,l} > T_{d} \end{cases}$$

$$\mathbf{d}_{k,l} : \quad d_{k,l} = \|c_{k} - c_{l}\| \text{ is the Euclidean distance between two colors}$$

$$d_{\max} = \alpha T_{d}$$

Dominant Color Descriptor (8)

- Similarity Matching:
 - Dissimilarity (Ds):

$$D_S = w_1 abs(s_1 - s_2)D + w_2D$$

w₁ = 0.3, w₂ = 0.7 (recommanded)

Dissimilarity (D_v):

and

$$D_{V} = \sum_{i=1}^{N_{1}} \sum_{j=1}^{N_{2}} p_{1i} p_{1j} f_{1i-1j} + \sum_{i=1}^{N_{1}} \sum_{j=1}^{N_{2}} p_{2i} p_{2j} f_{2i-2j} - \sum_{i=1}^{N_{1}} \sum_{j=1}^{N_{2}} 2 p_{1i} p_{2j} f_{1i-2j}$$
where
$$f_{x_{i}-y_{j}} = \frac{1}{2\pi \sqrt{v_{x_{i}-y_{j}}^{(l)} v_{x_{i}-y_{j}}^{(u)} v_{x_{i}-y_{j}}^{(u)} v_{x_{i}-y_{j}}^{(u)}}}$$

$$\times \exp\left[-\left(\frac{c_{x_{i}-y_{j}}^{(l)} v_{x_{i}-y_{j}}^{(l)} + \frac{c_{x_{i}-y_{j}}^{(u)}}{v_{x_{i}-y_{j}}^{(u)}} + \frac{c_{x_{i}-y_{j}}^{(u)}}{v_{x_{i}-y_{j}}^{(u)}}\right) \right/ 2\right]$$
and
$$c_{x_{i}-y_{j}}^{(l)} = (c_{x_{i}}^{(l)} - c_{y_{i}}^{(l)})^{2}, v_{x_{i}-y_{j}}^{(l)} = (v_{x_{i}}^{(l)} + v_{y_{j}}^{(l)})$$

Dominant Color Descriptor (9)

Similarity Matching Results:

Table 13.3 ANMRR results for dominant color

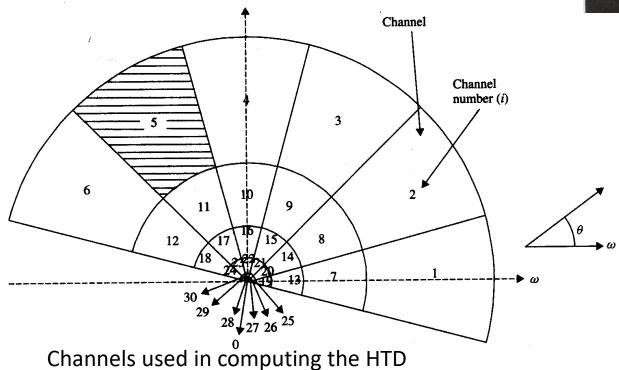

Average number of colors	ANMRR(D)	$ANMRR(D_S)$	$ANMRR(D_V)$
3	0.31	0.30	0.25
5	0.25	0.21	0.16

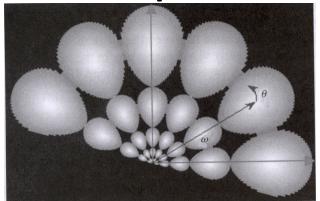

Texture Descriptors

- Homogeneous Texture Descriptor (HTD)
- Texture Browsing Descriptor (TBD)
- Edge Histogram Descriptor (EHD)

Homogeneous Texture Descriptor

$$HTD = [f_{DC}, f_{SD}, e_1, e_2, ..., e_{30}, d_1, d_2, ...d_{30}]$$
 62 numbers (496 bits)

Texture feature channels modeled using the Gabor functions in the polar frequency domain

HTD Extraction

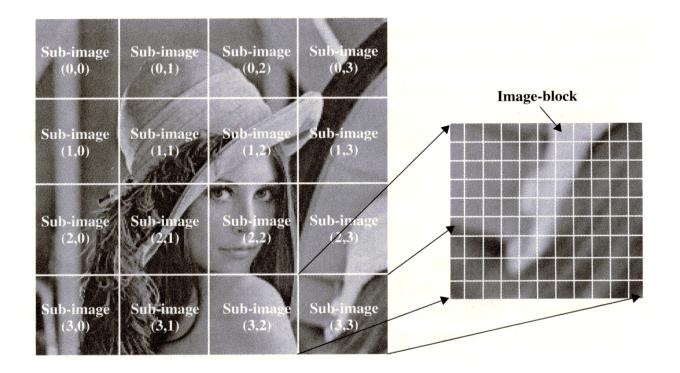

$$HTD = [f_{DC}, f_{SD}, e_1, e_2, ..., e_{30}, d_1, d_2, ...d_{30}]$$

- On the basis of the frequency layout and the Gabor functions:
- e_i: log-scaled sum of the square of the Gaborfiltered Fourier transform coefficients of an image:

$$e_i = \log_{10}[1 + p_i]$$
where $p_i = \sum_{\omega=0^+\theta=(0^\circ)^+}^{1} \left[G_{s,r}(\omega,\theta) |\omega| P(\omega,\theta) \right]^2$

Edge Histogram Descriptor

- Divide the image into 4x4 subimages
- Block-based edge extraction

Semantics of the Histogram bins of the EHD

• 5 edge type x 16 subimages = 80 histogram bins

H_{E}	Semantics
h(0)	Relative population of vertical edges in subimage at (0,0)
h(1)	Relative population of horizontal edges in subimage at (0,0)
h(2)	Relative population of 45° edges in subimage at (0,0)
h(3)	Relative population of 135° edge in subimage at (0,0)
h(4)	Relative population of nondirectional edges in subimage at (0,0)
	The second secon
h(75)	Relative population of vertical edges in subimage at (3,3)
h(76)	Relative population of horizontal edges in subimage at (3,3)
h(77)	Relative population of 45° edges in subimage at (3,3)
h(78)	Relative population of 135° edges in subimage at (3,3)
h(79)	Relative population of nondirectional edges in subimage at (3,3)

Shape Descriptors

- Region-based descriptor
- Contour-based descriptor
- 3-D Shape Descriptor

Region v.s Contour (1/2)

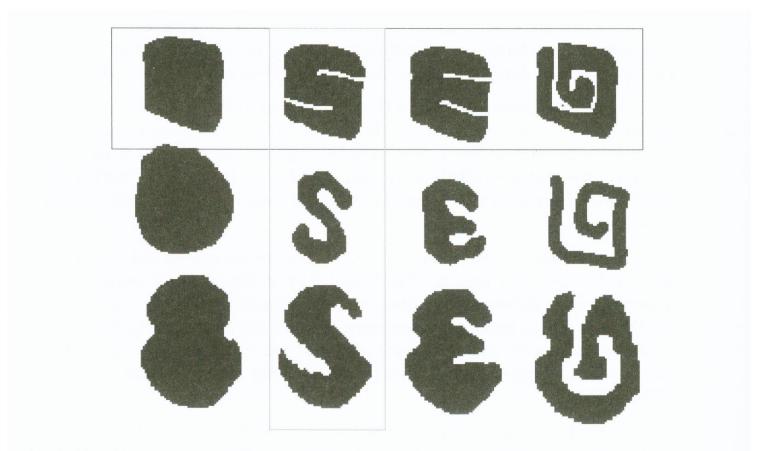

Figure 15.1 Example of contour-based and region-based region similarity (© 2001 IEEE, from M. Bober; MPEG-7 Visual Descriptors, IEEE Transactions on Circuits and Systems for Video Technology, Vol. 11, No. 6, June 2001)

Region v.s Contour (2/2)

Figure 15.2 Example of shapes in which region-based shape is applicable

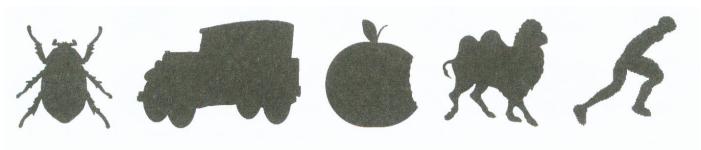

Figure 15.3 Examples of shapes in which contour-based shape is applicable

Goal of SDs

- Fast search and browsing
 - Concise manner
- Robust to
 - Scaling
 - Translation
 - Rotation

Region-based descriptor

- Take all pixels into account
- Project the shape onto the 2-D domain by using ART

Angular Radial Transform

$$F_{nm} = \langle V_{nm} (\rho, \theta), f (\rho, \theta) \rangle = \int_0^{2\pi} \int_0^1 V_{nm}^* (\rho, \theta) f (\rho, \theta) \rho d\rho d\theta$$

$$V_{nm}(\rho,\theta) = A_m(\theta)R_n(\rho)$$

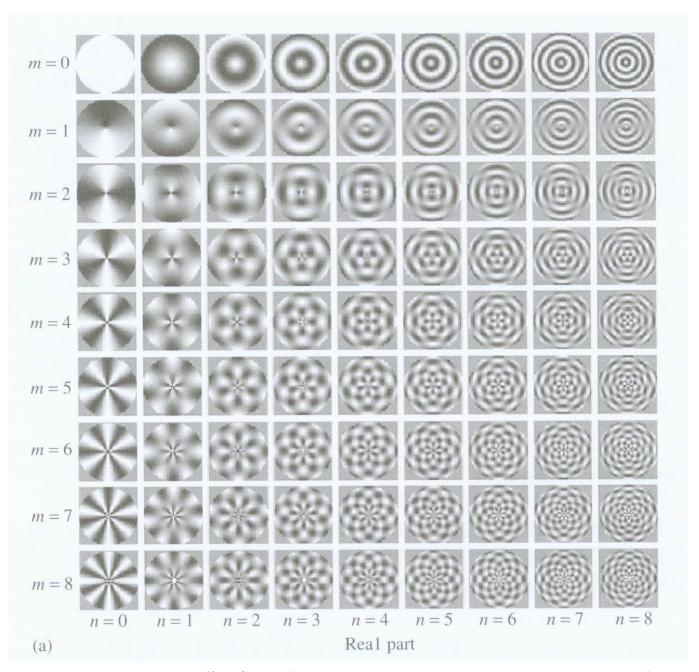

$$A_m(\theta) = \frac{1}{2\pi} \exp(jm\theta)$$

$$R_n(\rho) = \begin{cases} 1 & n = 0 \\ 2\cos(\pi n\rho) & n \neq 0 \end{cases}$$

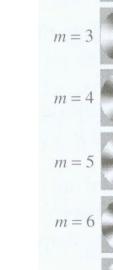

F: image function

V: ART basis

Define on unit circle in polar system

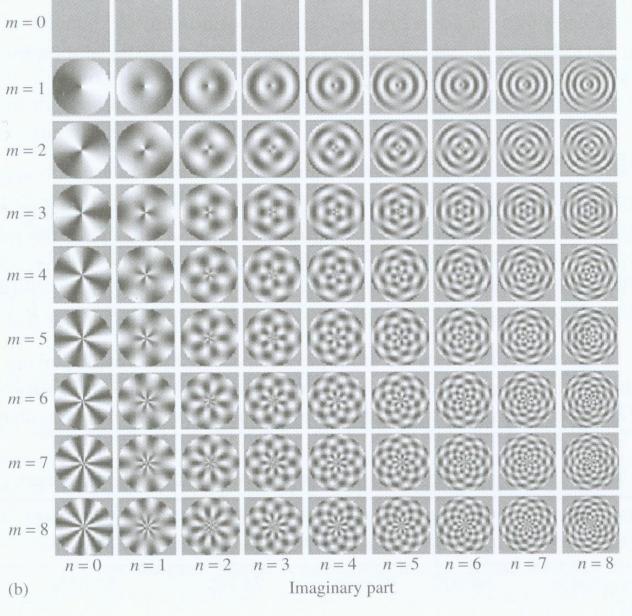

ART basis Real part

ART basis

Imaginary part

Real and imaginary parts of ART basis functions **Figure 15.10**

Descriptor Representation

Field	Number of bits	Meaning
Magnitude of ART[k]	4	An array of 35 normalized and quantized magnitudes of the shape coefficients.

Angular (m):0~11

Radial (n) :0~2

Normalize by F_{00} :

 F_{nm}/F_{00} $n=0^2,m=0^11$

Contour-based descriptor

- Take only border pixels into account
- CSS representation

CSS Representation

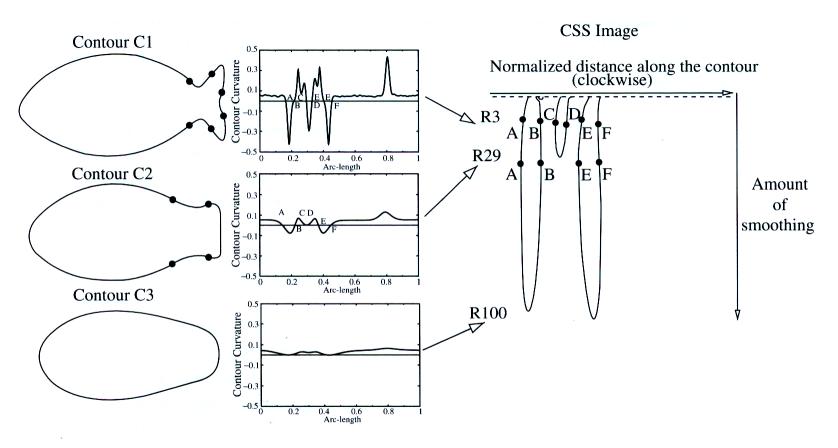

Figure 15.13 Extraction of the CSS image for the fish contour of Figure 15.12

Descriptor Representation

- Number of Peaks [6 bits]
- Global Curvature [2*6 bits]
- Prototype Curvature [2*6 bits]
- Highest Peak Y [7 bits]
- Peak X [6 bits]
- Peak Y [3 bits]

Motion Descriptors

- Motion Activity Descriptor
- Camera Motion Descriptor
- Motion Trajectory Descriptor
- Parametric Motion Descriptor
